

Highlights

Delegation cascades in evolutionary games: stable computation with strategic depth

Trung-Kiet Huynh, Dao-Sy Duy-Minh, Chi-Nguyen Tran, Nguyen Lam Phu Quy, Pham Phu Hoa

- Strategic depth creates a liability shelter in evolutionary games
- Maximum-shifted $O(Z)$ fixation sums stabilise the reduced Markov chain
- Joint erosion and attribution loss raise unsafe frequency from 0 to 0.322
- A floor closely traces the depth-cap frontier over its attainable range
